

Android lies at the intersection of two Enea core areas of expertise, advanced mobile platforms and Linux. Our competence center has the infrastructure and resources to take on anything from small driver projects to complex system integration.

Get the most out of the platform

Our Android competence center assists hardware manufacturers who need to create drivers or other platform software for new mobile phones. We help application developers with performance analysis and expertise to get the most out of the platform.

Application solutions

We are able to go beyond the platform and enable solutions for third parties that need an Android application as part of their system solution, marketing strategy or as an extra channel to their customers.

**Enea - 20 years
experience on
mobile platforms
brought to
Android**

Linux and RTOS experience

Enea's background in real time operating systems, Linux, platform integration and advanced functionality for feature and smart phones makes Android a natural fit for our services team.

Training

We offer an extensive and flexible training package with focus on the platform level.

Services and Training

The Enea team assists hardware and software developers with all aspects of the Android platform from the lowest level drivers and system software all the way up the stack to the application layer. Please visit www.enea.com/android for more information.

Service	Background	Role of the Competence Center
Expert support and consulting services	Getting support from open source forums and searching the internet can get you a long way with Android. However, there are situations where you may not want to disclose your product specifics on the web or need advice on issues that are poorly handled by the community.	Our senior experts are available to discuss Android problems over the phone or in person. We can suggest ways to interface the platform and can contribute to especially tricky algorithms. With an advisor from Enea your project will always have an expert on hand to give feedback, even if it is the first Android project you are undertaking
Training	There is a lot of high level information and training on how to write Android applications. When you take the next step and want to interact more closely with the platform there is a more limited amount of information outside the official mailing lists.	Our modular training on the Android platform covers most parts of the framework, Linux kernel and development tools needed to successfully work with Android.
Platform Projects	OEMs and hardware manufacturers that want to quickly become a supplier of Android products need to offer the software to support their products in the Android platform. This may include anything from Linux drivers to JNI interfaces and system services in the Android runtime	Enea has teams with experience in Android platform development. We are able to take on projects ranging from small to medium size to support new functionality in the Android ecosystem or to add new hardware to existing interfaces.
Application Projects	Getting your mobile applications to marketing quickly is essential. Since the platform is open, competition comes from all over the world and from all sorts of traditional and emerging sources. How do you get your idea built, tested and deployed rapidly to take advantage of the opportunity?	Our application team can help implement the engines to drive your advanced application idea. Our system knowledge make us especially well suited for combined projects where you want an Android application to interact with other technical components or equipment. Enea is knowledgeable, fast and flexible and the ideal partner to assist with your market beating application.
